

TIMER RESERVATION DEVICE

ABSTRACT OF THE DISCLOSURE

5 A timer reservation device which can display the recordable term of a reserved program to be executed repetitively, as well as of a one-shot reservation. In the timer reservation device, a CPU calculates up to what date the reserved program to be executed repetitively is recordable on
10 a record medium, based on the remaining recordable capacity of the record medium and the recording time of one execution of the reserved program, and displays the date on a display unit. Moreover, even in the presence of another reserved program to reserve a recording only at a designated date, the date up to
15 which the recording by the repetitive reserved program is executable can be calculated likewise, based on the recording time of the reserved program to be executed only at a designated date as well. Then, the date can be displayed to improve inconveniences resulting from shortage of record medium
20 capacity available.
